

Seacork is an eco-friendly, slip-resistant, lightweight deck covering material with excellent inherent strength, acoustic and thermal insulation properties. It is composed of 70% natural cork, harvested from oak trees* grown along Mediterranean coastlines. Soft under foot, not slippery when wet, it has natural air cushioning and remains stable at extreme temperatures — cool when hot, warm when

cold. Seacork is a natural sound and heat insulator — it will keep engine noise to a minimum and will insulate the interior of a boat from direct sunlight above.

Perfect for saving weight, without compromising on safety, Seacork has a density of just 400kg per cubic metre which means that a plate measuring 1 square metre (in 8mm thick material) weighs just 3.2kg. It can be installed on any vessel — GRP, composite, steel, aluminium, ferro-cement or wood. The ease of installation (left), using a weatherproof

polyurethane adhesive, ensures that the long lasting benefits of your Seacork deck will be retained year after year. To give an idea, price, including installation, starts at around HK\$2,000 per square metre.

Asia Yacht Services has chosen Seacork to cover the decks of its new LoftBarge 70 Skylounge (top and above), berthed in Gold Coast Marina. This liveaboard combines the effects of a loft apartment in an old industrial building with a marine lifestyle. Of the LoftBarge's 3,000 square feet of space, 430 are now covered with Seacork.

For more information contact Seacork Asia. Tel: +852 2559 6941 or Email: info@seacorkasia.com

** the first stripping is only carried out when the oak tree is at least 25 years old. Thereafter, harvesting occurs every nine years*
